

# 1 Introduction

The quality of public education in the across the world, and particularly in the developing world, remains low: functional illiteracy is widespread, and children do not master basic arithmetic operations. How can these educational outcomes be improved? Previous studies have found that incentives, whether these be electoral or performance-related, can help raise the quality of public services [Gulzar and Pasquale, 2017, Duflo et al., 2012]. Often relying on quasi-experimental research designs, these studies provide compelling evidence that actors respond to policy interventions.[Finan et al., 2015] But it remains unclear how these incentives connect to the broader institutional environment: who delivers public services and what political institutions shape their behavior?

In this paper, I build on extensive fieldwork research across Brazil to argue that the executive-legislative bargain shapes public education, leading to capture by local political elites. Similar to coalition building in presidential contexts, mayors bargain for legislative support for their policy agenda through the allocation of public sector positions to city councilors and their constituencies [Laver and Shepsle, 1990, Power, 2010]. This effectively crowds out electoral accountability, as mayors prioritize building support by other political elites over voter welfare [Ferejohn, 1986]. By catering to the city council through patronage appointments, mayors ultimately cause instability in the local educational bureaucracy, with negative downstream consequences for public school students.

To analyze how politics affect staff turnover, I analyze the relationship between municipal education staff turnover and the share of seats controlled by the executive in the local city council. In line with qualitative accounts and theoretical expectations, mayors who face stronger legislative opposition resort to greater patronage, in particular during the first year of administration. Mayors therefore resort to patronage in order to shore up legislative support, with negative consequences for student learning. I leverage data on over 2 million school teachers and school principals to estimate the effect of share of executive seats on turnover. Different model specifications confirm that turnover increases (decreases) as the share of seats held by the mayor coalition decrease (increase).

To estimate the effect of patronage on quality of education, I combine qualitative and quantitative evidence. Interviews conducted with educational bureaucrats and politicians confirm that turnover has a negative impact on teachers' ability to educate students. To validate these accounts I combine administrative data on education from the *Prova Brasil*, a nation-wide standardized exam designed to

measure student learning. I construct a multiple datasets to test these claims: the main specification contains over 1 million classrooms spread across the national territory. Using the national school census (*Censo Escolar*), I construct a school-specific turnover index that tracks year-by-year volatility in teacher staff. A set of estimations, combining multi-level modeling and fixed effects, provide strong evidence that teacher turnover has a negative effect on student learning.

This study contributes to an emerging literature on the politics of personnel and public services [Pepinsky et al., 2017, Finan et al., 2015, Gulzar and Pasquale, 2017]. Focusing on political actors refines our understanding of local politics and how intra-elite bargain reshape bureaucracies, leading to welfare loss for the broader population, as subnational actors divert resources from public services [Ferraz et al., 2012]. It also shifts focus from provision to the implementation of public services, echoing a long-standing literature on state capacity and the necessity for bureaucratic autonomy [Kohli, 2004, Evans, 1995].

The paper is structured as follows. Section 1 provides an overview of the scholarly debate over public goods provision and personnel, as well as more specific treatments of the subject in Brazil. In section 2 I present the main theoretical argument, with a formal treatment of the subject. Section 3 presents the institutional context and data, followed in section 4 by the research design and main results. Section 5 concludes.

## 2 Related literature

In this section I review extant literature on public goods provision and the politics underlying it, focusing on more recent studies of bureaucratic personnel and political leaders reshape these institutions. I also highlight how my research incorporates multiplicity in political actors and how this affects bargaining over public sector jobs. I address this gap by adapting previous analyses of executive-legislative bargaining to bureaucratic control at the local level.

### **Bureaucratic personnel and public goods provision**

Bureaucracies have a clear impact on the delivery of public services. A long-standing literature on state capacity provides a theoretical and substantive foundation to analyze bureaucratic institutions [Centeno et al., 2017, Kohli, 2004]. A first generation of scholars, focusing on the successful developmental cases of East Asia, highlighted the need for a technocratic and autonomous bureaucracy [John-

son, 1982, Kohli, 2004]. A Weberian wall separating bureaucrats from elected officials was considered indispensable for the successful provision of economic growth [Evans and Rauch, 1999].

Recent studies have added nuance to these claims, finding that high bureaucratic performance can coexist with political interference. Toral 2019 finds in Brazil that school principals appointed by mayors tend to perform better than their non-appointed counterparts in standardized test scores. Gulzar and Pasquale [2017] show that local politicians who are able to internalize electoral benefits make bureaucrats exert more effort, increasing local employment. Akhtari et al. [2015], on the other hand, highlight the pitfalls of political capture, showing that party turnover can lead to the replacement of school principals, with detrimental effects for student learning.

This recent wave of studies shed light on the intersection between politicians and bureaucracies. However, few of these studies explicitly model the multiple actors involved in managing bureaucracies. Understanding their diverse goals and action space provides a firm theoretical foundation to how different politicians can reshape bureaucracies. To do so I turn to the well-established literature on executive-legislative bargaining, applying its insights to the analysis of local government and administration.

## **Presidential coalitionism and patronage**

For every elected mayor in Brazil, a group of legislators are also elected into office. These political actors have competing claims over the local bureaucracy, with important implications for public service delivery. This structure parallels other settings with an institutionalized separation of powers and a bureaucratic pie to be split among the actors [Grindle, 2012, McCarty, 2004]. Divergent political interests can lead to strategic interaction between executive and legislative actors. A rich literature in Brazil explores these relations, with important insights to how executive and legislators bargain over bureaucracy. Raile et al. [2011], Power [2010].

In the Brazilian federal context, executive-legislative relations are analyzed under the prism of presidential coalitionism. Executive leaders garner legislative support from the National Congress by exchanging key positions in the federal bureaucracy, appointing members of their legislative coalition into cabinet positions. [Raile et al., 2011]. In a setting characterized by weak party cohesion and programmatic commitments Ames [1995], Lucas and Samuels [2010], bureaucratic

positions for members of the coalition provide material incentives for legislators to support the executive agenda Batista [2013], Neto [2006], Figueiredo and Limong [1999].

In municipalities, mayors have to garner legislative support from city councilors to secure budgetary approval and implement desired policies. Due to weak programmatic commitments at the local level, public sector jobs are used to legislative support.<sup>1</sup> Mayors enjoy full discretion into how to appoint workers into the public sector, and use patronage to coopt legislative support from members of the coalition, a practice known locally as *empregoismo*. As noted by a former mayor of the municipality of Sobral, "city councilors knocked on my door with a list of names for people they wanted me to hire."<sup>2</sup> These hires induce changes in personnel, with important consequences for bureaucracies and educational services.

## Bureaucratic turnover and inexperienced education

Bureaucracies exposed to turnover experience productivity shocks, often with detrimental effects. As new staff enters the bureaucracy, they must learn and acquire skills to deliver services to the population Gailmard and Patty [2007]. Focusing on education, studies show that students taught by inexperienced teachers perform worse than those attending class with an experienced teacher Clotfelter et al. [2007]. Akhtari et al. [2015] finds that students attending a school with a recently appointed school principal perform worse in standardized test scores. When bureaucratic turnover is driven by patronage, political concerns take precedence over meritocratic ones Colonnelli et al. [2017].

"I am aware that the position is temporary. Especially because it is a political position, decided by the administration. If the current administration is out of power, we are automatically dismissed." - Interview with school principal A, August 2019.

Negotiations between executive and the legislative thus have a knock-on effect on the quality of educational services, as political considerations lead to bureaucratic turnover at the school and administrative level. In this study, the primary focus is on bureaucrats working within the boundaries of a school: school principals and teachers. In the following section I describe the institutional context for public education in Brazil, as well as the data employed for the the estimation.

<sup>2</sup>Interview with C, August 2019.

### 3 Institutional context and data

#### 3.1 Education in Brazil

In Brazil, responsibility for primary education is delegated to local governments [Paschoal and Machado \[2009\]](#). The municipal educational system has increased in relevance over the past few decades, as municipalities took on a larger proportion of students from state-level governments. Figure 1 plots the total number of students in primary education per government level, including private schools. As of 2016, over 25 million students were enrolled in over 115 thousand municipal schools.

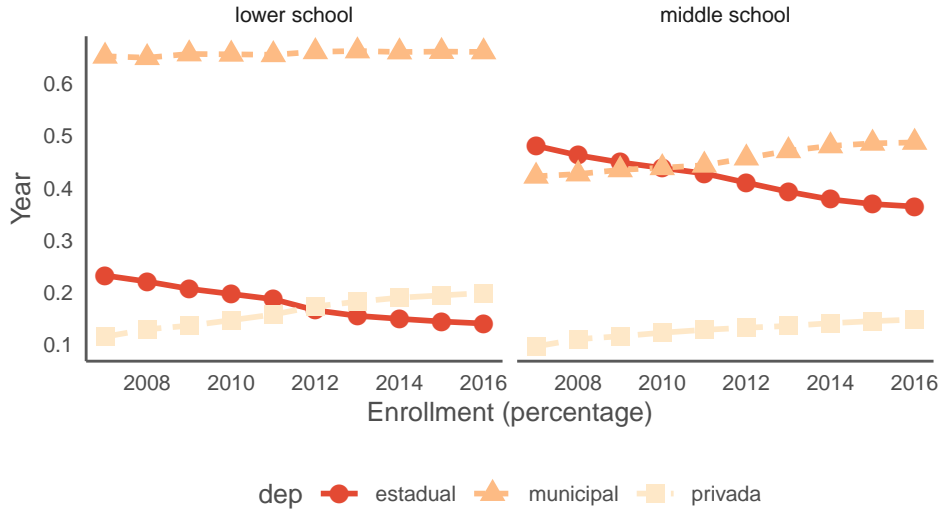

Figure 1: enrollment

The local executive branch has sole jurisdiction over the hiring and firing of teachers and school principals. School principals are considered positions of trust (*cargos de confiança*) and usually appointed by the mayor or secretary of education [Brollo et al. \[2017\]](#). Teachers usually enter the public service through a public exam and are eligible for tenure after two years [Gatti \[2010\]](#). However municipalities increasingly resort to temporary contracts to hire new teachers as budgetary pressures amount. Municipal teachers and school principals are overseen by a local department of education [Militão et al. \[2014\]](#).

Funding for municipal education relies primarily on federal transfers, the Fundeb, derived from 10 percent of tax revenues for each level of government to education. At the municipal level, 25 percent of the local budget must be allocated to education, and compensatory federal transfers are institutionalized by law to

those municipalities which do not reach the target.<sup>3</sup> While municipalities may be audited to verify whether funds are being properly used, personnel decisions and daily operations are fully under municipal discretion Ferraz et al. [2012].

### 3.2 Local governance and mayoral coalitions

Brazil's local level government is composed by over 5 thousand municipalities, each with their own mayor hall (*prefeitura*) and city council (*câmara dos vereadores*). Mayors and city councillors (*vereadores*) are democratically elected every four years, with the possibility of reelection for both.<sup>4</sup> The executive is responsible for the management of public services such as education, with exclusive rights over personnel appointment. The city council, on the other hand, oversees legislation and approves the budget for the fiscal year. As noted by Souza and Faria [2004], decisions over whom to appoint into the educational sector are primarily in the hands of the mayor and her secretary of education.

In order to win elections and garner support for their campaign, mayors form electoral alliances with local party labels DANTAS [2013]. These mayoral coalitions, once in government, are an important basis for approving budgets and, more generally, executive control over the legislative chamber. Interviews with city councilors indicate that the legislature is divided into a pro-government (*governo*) and opposition (*oposição*) groups (*bancada*). While these electoral coalitions do not necessarily remain intact once governments are formed, fragmentation is generally on the margins, with mayors swapping defecting legislators for new ones.<sup>5</sup>

Interviews with secretaries of education and mayors provide evidence that city councilors play an important role in staffing decisions. While mayors hold jurisdiction over personnel decisions, there are extensive consultations between mayors and city councilors to decide who becomes the principal of a school, or which teacher remains in a school or leaves. These executive-legislative consultations ultimately determine the allocation (*alotação*) of educational staff, serving as the primary tool through which mayors reward or coopt legislators into supporting them in the city council. In the words of a set of school administrators in the municipality of I:

*School principal:* Here, we are invited to work at the school by the department of education, with the [political] candidate, the city coun-

---

<sup>3</sup>For more details on the Fundeb, see [here](#)

<sup>4</sup>The last municipal elections were in 2016. These take place every 4 years.

<sup>5</sup>Interview with C, former chief of staff of municipality J. September 2018.

cilor...deciding which are the positions they are searching for and appointing people they think have the necessary qualifications.

*Educational counselor:* I was also invited to work here, by the city councilor and the department of education.<sup>6</sup>

These accounts, along with previous case studies of municipalities in Brazil, suggest that city councilors play an important role in nominating staff. To verify these claims in a broader set of municipalities, as well as outlining the research design, I apply a theory of legislative vote-buying that illustrates the employment of extensive administrative and electoral data collected by the Brazilian federal government. In the next section I describe the data, where it is publicly available, as well as the preparation necessary for the set of estimations presented in the study.

### 3.3 Data

Brazil collects fine-grained data on education and makes it publicly available for research. For this study, data on education are collected from two main sources: the SAEB and School Census.<sup>7</sup> The SAEB (National System for Educational Assessment) is a biannual standardized exam administered by the INEP (National Institute for Educational Studies and Research) to all public schools and a sample of private schools. In 2017, over 5 million students, in 5th and 9th grade, took the exam, testing their proficiency in both mathematics and Portuguese. In this study, test scores are the primary metric for assessing the quality of education received by students.

Figure 2 presents a map of Brazil with the municipal averages for the SAEB of 2015. Warmer colors such as red and orange indicate higher average scores, with the converse denoted by colder, blue shades. There is clear variation in average test scores, with the Southeast and Midwest outperforming poorer regions in the North and Northeast. Even within regions, however, there is wide heterogeneity. In particular, note that in the northern part of Brazil, high-performing municipalities neighbor low-performing ones. This indicates that despite spatial clustering, municipal factors can lead to variation in the quality of education.

Employment data on educational staff, including teachers and school principals, are extracted from the RAIS, SAEB and the School Census.<sup>8</sup> The *Relatório Anual de Informações Sociais* (RAIS) is an annual census administered by the now

<sup>6</sup>Interview with the administrative board of school A., municipality J. August 2019.

<sup>7</sup>These can be accessed [here](#).

<sup>8</sup>RAIS data, along with additional Brazilian employment data, can be accessed [here](#).

Figure 2: hello

Ministry of Finance to all formal employers in Brazil. Employers are mandated to accurately report data on employees, subject to fines for misreporting. Subnational governments, including municipalities, also report to the RAIS. The dataset therefore contains micro-level information on all municipal personnel, including when they were hired/fired, as well as wages, type of contract and education levels.

Figure ?? provides descriptive statistics on bureaucratic personnel in Brazil, segmented by department. Educational staff, in this case school principals and teachers, comprise approximately a third of municipal public sector jobs, totaling around 2 million in 2015. While comparable to administrative staff, this total significantly exceeds that for healthcare services. Focusing on turnover, we note that new hiring and dismissals in education staff is relatively high. While lower than that for administrative staff, new hires can represent over 10 percent of extant staff. The past two decades was a moment of rapid expansion of municipal staff, and hiring has far exceeded dismissals in that time period.

Figure 3: hello

I propose three different specifications for measuring bureaucratic turnover. From the RAIS I obtain the percentage of teachers and principals who are dismissed and hired at any given year. Using school census data, it is possible to track individual teachers across time and schools. With that data I calculate a turnover index for school  $s$ , in municipality  $j$  at year  $t$ , based on an index proposed by [Pereira Junior and Oliveira \[2016\]](#). The number of teachers leaving and entering the school at a given year are summed and divided by the total number of teachers in the current and previous period.

$$\text{turnover}_{sjt} = \frac{\text{exit}_{sjt} + \text{entry}_{sjt}}{N_{sjt} + N_{sjt-1}}$$

Information on mayor, city councilors and mayoral coalitions are made available by the Supreme Electoral Court (TSE), the national authority responsible for overseeing elections.<sup>9</sup> In order to calculate the share of legislative seats held by the mayoral coalition, I match the partisanship of each city councilor to the mayoral electoral coalition. The distribution of share of coalition seats is depicted in figure 4. Note that although most city councils are controlled by the mayor, in over 40 percent of municipalities the mayoral coalition is a minority government.

Additional data has been collected to supplement the estimation exercise. Sociodemographic data comes from the National Institute for Statistics and Geography (IBGE), budgetary data from (FINBRA) and student test scores from Ceará

<sup>9</sup>Available [here](#).

## 4 Theory

### The Setting

The government  $G$  and opposition  $O$  compete over legislative votes to enact their preferred policies.<sup>11</sup> There are two possible outcomes: a policy  $x$  favored by the government, and the status quo, denote as  $y$ , preferred by the opposition. In order to implement her policy the mayor must pass a simple majority vote in the city council, comprised of an odd number  $N$  of legislators. The total amount of political resources available is  $W_G$  and  $W_O$ , which for the mayor includes public sector appointments.

Each city councilor is characterized by a publicly observed policy preference  $v_i$  for all  $i \in N$ , where  $v_i > 0$  denotes that the mayor's proposal  $x$  is preferred by legislator  $i$ . Let  $\mathbf{v} = (v_1, \dots, v_n)$  describe the preference profile for the city councilors. In this setting,  $v_i$  measures the degree to which an individual city councilor supports the mayor, with higher values of  $v$  denoting stronger support for the mayor and vice versa. Payoff are realized when city councilor  $i$  votes,

<sup>10</sup>Respectively, data can be found here: (1)<https://ces.ibge.gov.br/base-de-dados/links-base-de-dados.html>, (2)[https://siconfi.tesouro.gov.br/siconfi/pages/public/consulta\\_finbra/finbra\\_list.jsf](https://siconfi.tesouro.gov.br/siconfi/pages/public/consulta_finbra/finbra_list.jsf), (3)<https://www.seduc.ce.gov.br/spaeece/>.

<sup>11</sup>Note that for this model, I use the terms *mayor* and *government* interchangeably.

independent of the outcome of the voting procedure. This sincere voting preference closes the possibility of general equilibria in which  $i$ 's voting behavior affect  $j$ .

We solve the game through backward induction. The timing of the game is as follows:

1. Government  $G$  offers a bribe schedule  $a \in (a_1, \dots, a_n) \in \mathbb{R}_+^n$ .
2. Opposition  $O$  observes the bribe schedule  $m$  and makes a counter-offer  $b \in (b_1, \dots, b_n) \in \mathbb{R}_+^n$ .
3. City councilors cast their votes at the end of bribing period.
4. Nature sums legislative votes, legislative outcome is decided and payoffs are realized.

Given a bribe schedule  $(a, b)$ , councilor  $i$  prefers to vote for the mayor's proposal  $x$  if  $a_i + v_i > b_i$  and the status quo  $y$  otherwise. Since indifferent councilors vote for the status quo, the opposition needs to only match bribes from  $M$ , adjusting for individual preferences, i.e.  $b_i = a_i + v_i$ . For the mayor, she needs to construct the cheapest winning coalition in order to defeat the opposition.

Following Groseclose and Snyder (1996) and Banks (2000) we focus our analysis on the set of equilibria in which the mayor wins.<sup>12</sup> In this context, the amount of patronage resources  $W_G$  is sufficiently large relative to  $W_O$  and  $\mathbf{v}$  that the mayor's preferred policy  $x$  is implemented over  $y$ . Let  $U(\mathbf{v}, W_O)$  denote the set of unbeatable patronage schedules for the mayor, and for any patronage schedule let  $S(a) = \sum_{i=1}^n a_i$  be the total amount of patronage disbursed. The mayor then solves

$$\min_a \{S(a) : a \in U(\mathbf{v}, W_B)\} \quad (1)$$

Note that for any equilibrium strategy, it must be the case that mayor  $M$  uses a leveling schedule: every city councilor in her coalition  $C$  is equally expensive for the opposition  $O$  to bribe. More formally, for any  $a \in \mathbb{R}_+^n$ , let  $C(a) = \{i \in N : a_i > 0\}$  denote the set of individuals who receive a bribe from from the government  $G$ . One can show that there is a bribe schedule  $a'$  such that for any  $i, j \in C(a)$ ,  $a'_i + v_i = a'_j + v_j$ . The intuition is that the mayor has no incentive to make voters differentially expensive, because the opposition  $O$  will simply ignore the more

---

<sup>12</sup>Since strategies for both players are symmetrical, any set of equilibria in which the mayor loses can be modeled as cases in which the the opposition loses.

expensive voters and target the least favorable members of the coalition. We refer to these strategies as leveling schedules.

We can characterize the set of equilibria in the game by introducing additional notation. Let  $U^l(\mathbf{v}, W_O) \subseteq U(\mathbf{v}, W_O)$  denote the set of unbeatable leveling schedules. These are bribe schedules such that  $a_i + v_i = a_j + v_j \equiv t(a)$ . The bribe  $a_i = t(a) - v_i$  is the sum of two terms. The first is the common "transfer" among all voters in  $C(a)$ , the second ( $-v_i$ ) is individual specific. The latter term makes voters indifferent between  $x$  and  $y$  absent any bribe from  $B$ ; the former represents the per capita amount necessary to make  $C(a)$ , together with any unbribed voters, unaffordable for  $B$ .

I impose the following two assumptions:

$$A1 : v_{(n+1)/2} < 0$$

$$A2 : v_1 < 2W_B/(n+1)$$

A1 implies that absent any bribes by  $A$ ,  $y$  will defeat  $x$ . Therefore  $A$  must bribe at least one voter. A2 implies that  $A$  must bribe at least a majority of voters, otherwise  $B$  will have sufficient resources to bribe  $(n+1)/2$  voters and win. A2 also implies that for all  $a \in U^l(\mathbf{v}, W_B)$ , it must be that  $t(a) \geq 2W_B/(n+1)$ , otherwise  $B$  can bribe a majority from  $C(a)$  itself and win the vote.

These assumptions allow us to restrict our analysis to unbeatable monotonic leveling schedules, which we denote as  $U_m^l$ .<sup>13</sup> We can simplify the total expenditure on patronage by the government,  $S(a)$ , as

$$S(a) = \sum_{i \in C(a)} a_i = k(a) \cdot t(a) - \sum_{i \leq k(a)} v_i$$

Note that the choice of  $k(a)$  and  $t(a)$  fully characterize any schedule  $a \in U_m^l(\mathbf{v}, W_B)$ . We can thus fully characterize the optimization problem of  $A$  in equation 1 as

$$\min_{k,t} k \cdot t - \sum_{i \leq k} v_i$$

subject to the constraint that the induced schedule  $a \in U_m^l$ . We can reformulate this as an unconstrained problem by noting the following. First, if  $a(k, t, \mathbf{v})$  is unbeatable, it must be that  $k \geq (n+1)/2$ , so by A1 it must be that if  $a_i(k, t, \mathbf{v}) = 0$ , then  $v_i < 0$ . Therefore,  $B$  receives all non-bribed voters for

---

<sup>13</sup>A detailed explanation can be found in the appendix.

free. For  $a(k, t, \mathbf{v})$  to be unbeatable, then, it must be that  $B$  cannot afford the remaining  $(n + 1)/2 - (n - k) = k - (n - 1)/2$  voters, or

$$t \cdot (k - (n - 1)/2) \geq W_B$$

Solving this for equality yields the optimal transfer from  $A$  to members of  $C(A) = \{1, \dots, k\}$ , conditional on  $k$ :

$$t(k, W_B) = \frac{W_B}{k - (n - 1)/2} \quad (2)$$

Defining minimal winning expenditures as

$$E(k, \mathbf{v}, W_B) = k \cdot t(k, W_B) - \sum_{i \leq k} v_i \quad (3)$$

we can state  $A$ 's problem as

$$\min_k \{E(k, \mathbf{v}, W_B) : k \in (n + 1/2), \dots, n\} \quad (4)$$

Denote the solution to expression 4 as  $k^*(\mathbf{v}, W_B)$ . This solution implicitly generates a solution to expression 1 through expression 3 and the induced bribe schedule above. Therefore, characterizing the optimal  $k^*$  is sufficient to fully characterize the optimal behavior of the mayor.

## Results

First, characterize a solution for  $k^*$ . Because  $k$  is finite, calculus cannot be employed. Instead, we deploy a discrete version of these techniques. First let's define  $\Delta(k) = E(k + 1) - E(k)$  as the difference in expenditure from adding another coalition member. Note that if  $\Delta(k) \geq 0$  then  $A$  does not want to add another member to the coalition. Conversely, if  $\Delta(k) < 0$ , then  $A$  is strictly better off by adding the  $k + 1$ th member of the coalition.

Next, suppose that  $\Delta(k)$  is increasing in  $k$ . The following algorithm can then be used to identify  $k^*$ : if  $\Delta((n + 1)/2) \geq 0$ , then we know from  $\Delta(k)$  increasing that  $A$  is better off by setting  $k^*$  to  $(n + 1)/2$ . If  $\Delta((n + 1)/2) < 0$ , then we know that  $k^*$  must be greater than  $(n + 1)/2$ , so we next solve for  $\Delta((n + 3)/2)$ , and so

on.

We can therefore search for the optimal  $k^*$  with the following algorithm:

$$k^* = \begin{cases} (n+1)/2 & \text{if } \Delta((n+1)/2) \geq 0 \\ \max\{k : \Delta(k-1) < 0\} & \text{otherwise} \end{cases} \quad (5)$$

We can also further characterize the change in minimum winning expenditures in equation 3 as

$$\Delta(k) = \left[ \frac{(k+1)W_B}{k+1 - (n-1)/2} - \sum_{i \leq k+1} v_i \right] \quad (6)$$

$$= \frac{-W_B(n-1)}{2(k+1 - (n-1)/2)(k - (n-1)/2)} - v_{k+1} \quad (7)$$

$$\equiv T(k, W_B) - v_{k+1} \quad (8)$$

Using equation 5 and substituting in equation 7 we have the following.

**Proposition 1.** (a)  $k^*(\mathbf{v}, W_B) = (n+1)/2$  if and only if  $v_{(n+3)/2} \leq -W_B(n-1)/4$ ;  
(b)  $k^*(\mathbf{v}, W_B) = n$  if and only if  $v_n > -2W_B/(n+1)$ .

Banks also identifies how the optimal coalition  $k^*$  respond to marginal changes in voter preference intensity. Given an arbitrary amount  $W_B$  and preference profile  $\mathbf{v}'$ , let  $k' = k^*(\mathbf{v}', W_B)$ . If  $k' = (n+1)/2$ , then we know that  $k' \leq k^*(\mathbf{v}, W_B)$  for all  $\mathbf{v}$ , so suppose  $k' > (n+1)/2$ .

From equation 5 we infer that  $\Delta(k'-1, \mathbf{v}', W_B) < 0$ , which from equations 7 and 8 is equivalent to  $v'_k > T(k'-1, W_B)$ . Now suppose that the preference profile changes from  $\mathbf{v}'$  to  $\mathbf{v}$ , and  $v_{k'}$  is such that  $v_{k'} \geq v'_k$ . Then,  $v_{k'} > T(k'-1, W_B)$ , and hence  $\Delta(k'-1, \mathbf{v}, W_B) < 0$ . But then from equation 5 it must be the case that  $k^*(\mathbf{v}, W_B) \geq k'$ . Therefore, the following holds:

**Proposition 2.** For all  $W_B$ , if  $\mathbf{v}$  and  $\mathbf{v}'$  are such that  $v_{k'} \geq v'_{k'}$ , where  $k' = k^*(\mathbf{v}', W_B)$ , then  $k^*(\mathbf{v}, W_B) \geq k^*(\mathbf{v}', W_B)$

In words, if the preference intensity of the marginal bribed voter weakly increases, then the optimal coalition size also weakly increases. Substantively, the number of voters bribed by  $A$  weakly increases as the voter who receives the largest bribe finds  $A$ 's preferred alternative,  $x$ , more attractive. Similarly

**Proposition 3.** *For all  $W_B$ , if  $\mathbf{v}$  and  $\mathbf{v}'$  are such that  $v_{k'+1} \leq v'_{k'+1}$ , where  $k' = k^*(\mathbf{v}', W_B)$ , then  $k^*(\mathbf{v}, W_B) \leq k^*(\mathbf{v}', W_B)$*

The “convexity” of  $E$  guarantees that local information is sufficient to generate comparative statistics regarding changes in preferences  $\mathbf{v}' \rightarrow \mathbf{v}$ . We can characterize the change in total expenditures as a result of a shift in voter preferences. Given two preferences  $\mathbf{v}$  and  $\mathbf{v}'$ , write  $\mathbf{v}$  and  $\mathbf{v}'$  if  $v_i \geq v'_i$  for all  $i \in N$ . From equation 3 we have

$$\begin{aligned} E(k, \mathbf{v}, W_B) - E(k, \mathbf{v}', W_B) &= \\ &= k \cdot t(k, W_B) - \sum_{i \leq k} v_i - \left[ k \cdot t(k, W_B) - \sum_{i \leq k} v'_i \right] \\ &= \sum_{i \leq k} (v'_i - v_i) \end{aligned}$$

Since  $v'_i - v_i \leq 0$ , the difference in expenditure between moving from a favorable to a less favorable legislature is always non-positive, i.e. the government has to spend less resources to pass her preferred policy. This holds despite the fact that when these preferences shift there is an increase in the overall size of the coalition. This result has a similar flavor to [Groseclose and Snyder Jr \[1996\]](#), who motivate their model by stating that it may be optimal to increase the size of the coalition (instead of buying a simple majority) because doing so overall can lead to a reduction in the amount of expenditures by the vote-buyer.

## Discussion

Enacting policy requires the exchange of political currency for votes. Whether it be in presidential coalitionism, or in the local city council politics, mayors who wish to govern have to engage in transactions with the legislature. What I showed in this section was that political misalignment between the government and the legislature can in fact be counterproductive: more patronage occurs, leading to worse public service outcomes.

The model also highlights a key aspect of clientelism that is often neglected electoral accountability models: voters have a limited voice. Ultimately, the exchanges which occur between the legislature and the mayor have little to do with the voter at the end of the pipeline, and more to do with the city councilors. The first order requirement for the government is to ensure that it has enough

legislative votes in order to enact the very policies that the voter may or may not desire. This transactional cost is not illegal: rather, it is necessary for democratic relations between different branches of government.

In the next section, I test whether the empirical implication of the model is correct: does more patronage occur in municipalities with greater political misalignment between the mayors and city councilors. I test additional implications of the model, including whether shifts in the resources controlled by the opposition can affect the government’s patronage strategy.

## 5 Empirical results

### Model specification

This study presents two sets of estimations. The first one identifies the effect of bureaucratic turnover on student learning, verifying the hypothesis that teacher and school principal turnover has a negative effect on the quality of municipal education. To do so, I leverage the test scores made available by SAEB and SPAECE to estimate the effect of turnover on student test scores. To avoid interference, individual test scores are aggregated at the classroom level, for each 5th and 9th grade of each school contained in the sample. The outcome of interest is thus the average test scores for all students in the same classroom (SAEB) or same grade (SPAECE), for a given school.

For the first estimation, I test the hypothesis that mayors who control less seats in the city council engage in more patronage. To do so I leverage employment data from RAIS and school census data to measure teacher turnover rates. I deploy three sets of models. For the second and third estimation I turn to the micro, bureaucrat-level and then to aggregated turnover at the municipal level. The first model is a logistic regression where the outcome of interest is whether a particular teacher or school principal is hired/fired for any given year. The second model is a linear model with fixed effects, where the outcome of interest is the proportion of educational staff hired/fired for a municipality at any given year. For the second set of estimations, the main specification is:

$$\text{turnover}_{jt} = \gamma \text{coalition seats}_{jst} + \mu P_{jt} + \zeta W_{jt} + \alpha_k + \delta_t + \epsilon_{jt}$$

The share of coalition seats held by the mayoral coalition is the treatment in this set-up. We are interested in  $\gamma$ , the change in bureaucratic turnover associated with variation in the share of legislative seats held by the mayoral coalition.

Municipal characteristics  $W_{jt}$  are similar to the ones used for the first set of estimation. I add political variables to the estimation in order to control for differences in mayor partisanship, incumbency status, and individual characteristics of the mayor: professional background, education, and age.

To estimate downstream effects of turnover on education, I employ a hierarchical linear model to estimate the effect of teacher turnover on average test scores for grade  $i$  at school  $s$ , in municipality  $j$  and year  $t$ . This estimation strategy has been used in multiple studies to analyze educational outcomes, due to its natural multi-level setting (classroom, school and municipality) as well as ability to incorporate covariates at each level of the estimation [DiPrete and Forristal, 1994, Lee, 2000] Let  $\text{grade}_{isjt}$  be a dummy variable equal to 1 if the classroom is in grade 9 and 0 otherwise. The main specification is as follows:

$$\text{test score}_{isjt} = \beta_1 \text{turnover}_{isjt} + \beta_2 \text{grade}_{isjt} + \beta_3 \text{turnover}_{isjt} \times \text{grade}_{isjt} + \psi X_{isjt} + \phi V_{sjt} + \zeta W_{jt} + \alpha_k + \delta_t + \epsilon_{isjt}$$

We are interested in  $\beta_1$  and  $\beta_3$ , the change in test scores associated with teacher or school principal turnover. In this set-up,  $\beta_3$  is the additional effect of staff turnover on test scores if students are in 9th grade. The first level is the grade, with associated characteristics  $X_{isjt}$  at the grade level: among others, percentage of students who have not graduated last year and share of children with a fridge in their house. The second is the school  $s$ , with characteristics  $V_{sjt}$ , such as access to internet or the presence of a cafeteria for students. The third level is the municipality  $j$ , including municipal sociodemographic characteristics ( $W_{jt}$ ) such as population size and median wages, as well as per pupil budgetary expenditures on education. Finally, I include state ( $\alpha_k$ ) and year ( $\delta_t$ ) fixed effects to account for unobserved time-invariant state characteristics and annual seasonality.

Despite the use of different educational quality and staff turnover metrics, addition of a relatively extensive set of controls, the estimation strategy proposed here remains observational. In the absence of exogenous shock in either turnover or coalition shares, a credible identification strategy for each set of estimations remains a challenge. To partially address these concerns, as an additional robustness check I replicate these estimations with weights estimated through a covariate balancing propensity score outlined in Imai and Ratkovic [2014] which is generalized for continuous treatments. A covariate balance test for either estimation is presented in the appendix.

## Results

I first turn to testing the main proposition of this paper: that turnover in educational staff stems indeed from coalitional dynamics. There is strong evidence that mayors who control more (less) seats in the city council resort to less (more) patronage. Figure ?? presents the results of the estimation. The first model regresses turnover index on coalition share, where the unit of analysis is a grade-level per school. Models 2 and 3 estimate the effect of the share of legislative seats on hiring or dismissal of individual bureaucrats. The third set of models (4 and 5) estimate the change in the share of new hires and dismissals at the municipal level. All models suggest that an increase in the executive share of legislative seats decrease turnover.

Figure 5: **Executive coalitions and staff turnover.** An increase in the share of legislative seats held by the mayoral coalition decrease the amount of turnover for teachers and school principals, including hires or dismissals. Model 1 presents results on the turnover index. Models 2 and 3 are logistic regressions at the individual, bureaucrat level. Models 4 and 5 are aggregated at the municipal level. where the outcome of interest is the proportion of staff either hired or dismissed at a given year. Models 1, 3, and 5 include year and state fixed effects.

Teacher and school principal turnover have significant, negative effects on average test scores, highlighting the potential dangers of bureaucratic turnover on student learning. These results are robust to alternative specifications of turnover, as well as the use of different quality metrics (SAEB, SPAECE) in our estimations. Table 6 presents the results of the estimation on SAEB test scores. We present two specifications for turnover. Turnover index measures the amount of turnover

in teachers at the school level. Work experience for teachers and school principals serve as an alternative measure of turnover. Personnel who has only recently entered the school recently amass a shorter amount of work experience (less than two years).

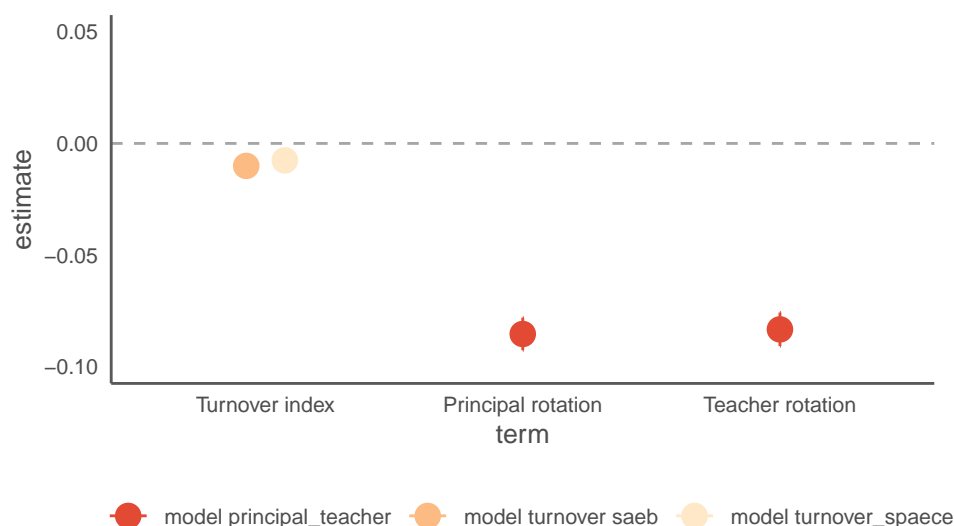

Figure 6: **Bureaucratic turnover and student learning** Teacher and school principal turnover have a negative effect on student learning. Models 1 and 2 present results for teacher turnover index constructed at the school level. Models 3 and 4 estimate the effect of new teachers and school principals entering the school (less than two years). All models include year and state fixed effects.

Include some reference coefs in order for the audience to assess the magnitude of the effects

## 6 Conclusion

Improving the quality of education received by children across the world remains a challenge. This paper proposes an analytical framework and estimation strategy to understand the decision-making process behind the administration of educational services in Brazil. In a decentralized context, subnational political actors have a direct say on how educational services are managed, with profound implications for the quality of public services delivered to citizens. These actors interact with bureaucracies and other local elites in complex ways that are only beginning to be mapped.

In this study I theorize and demonstrate that staff turnover stems from the executive's need to garner support from legislators in the city council. This process

of coalition building is consolidated through employment offers to city councilors and their constituencies. As the share of seats held by the executive coalition decreases, the costlier it becomes to coopt legislators to support the executive. As a result, the amount of patronage we observe should increase. That is precisely what the data indicates, with teacher turnover increasing in schools, as well as increased hiring and dismissals of teachers and school principals.

This bureaucratic turnover has important consequences for the quality of education delivered in municipalities. I find that turnover has a negative effect on student learning, across a set of specifications for turnover and different evaluation metrics for student learning. The evidence therefore seems to point out that mayors with a weaker hold on the city council resort to greater patronage, with negative consequences for student learning. This set of findings contribute to an emergent literature on the ambiguous consequences of stronger competition in weakly institutionalized contexts [Gottlieb and Kosec, 2019].

Future research on patronage and public service delivery would benefit from a clearer treatment of the institutional context in which local political actors operate. Important insights have been derived on executive leaders, but these actors seldom govern alone. Incorporating other local elites paints a more complex and accurate understanding of the strategic considerations taking place in the political management of education, and public services more broadly.
